The first time a game is run, Cemu must build the shader cache as the game is running instead of loading everything at startup. This can lead to increased stutter and lag when entering new areas or environments in game. You can choose to ignore it and let Cemu build the shader cache for you, or you can download already-built shader caches from other users for your games.

Visit CEMUcaches (Reddit) for a collection of user-contributed shader caches.

Cemu can load .wup / .wux files that you already possess. Wii U USB Helper can be used to download Wii U games directly to your PC to be installed with Cemu.
